Denote
$$G_5 := G_5(\mathbb{Z}_p)$$
, and $G_5^+ := G_5^+(\mathbb{Q}_p)$.
 $\zeta_{L_5,p}^{\wedge}(s) = \int_{G_5^+} |\det g|_p^s d\mu(G_5) = \int_{G_5^+} |\det uh|_p^s d\mu(G_5)$, where $h \in H$ and $u \in N_h$.

Each
$$u$$
 is unipotent, hence $\zeta_{L_5,p}^{\wedge}(s) = \int_{G_5^+} |\det h|_p^s d\mu(G_5) = \int_{G_5^+} |\lambda_1^4 \lambda_2^6 \lambda_3^6 \lambda_4^4|_p^s d\mu(G_5) = \int_{G_5^+} \left[|\lambda_1^4|_p |\lambda_2^6|_p |\lambda_3^6|_p |\lambda_4^4|_p \right]^s d\mu(G_5)$, by the inductive formula we have found

$$= \int_{G_5^+} \left[|\Lambda_1|p|\Lambda_2|p|\Lambda_3|p|\Lambda_4|p \right] \, d\mu(O_5),$$
 for every $|h|$.

We denote
$$v_i := v_p(\lambda_i)$$
,
and so $\zeta_{L_5,p}^{\wedge}(s) = \int_{G_5^+} \left[p^{-4v_1} p^{-6v_2} p^{-6v_3} p^{-4v_4} \right]^s d\mu(G_5) = \int_{G_5^+} p^{-(4v_1 + 6v_2 + 6v_3 + 4v_4)s} d\mu(G_5)$.

We denote $I(\underline{\lambda}) := p^{-(4v_1+6v_2+6v_3+4v_4)s}$. Now we use the natural matrix decomposition of the N_h matrix of Berman's, which means that

$$\zeta_{L_{5,p}}^{\wedge}(s) = \int_{G_{5}^{+}} I(\underline{\lambda}) d\mu(G_{5}) = \int_{\underline{\lambda}} \int_{\underline{a}} \int_{\underline{b}} \int_{\underline{c}} I(\underline{\lambda}) d\mu(\underline{c}) d\mu(\underline{b}) d\mu(\underline{a}) d\mu(\underline{\lambda}). \text{ Since } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in the computation of } I(\underline{\lambda}) \text{ depends only in the computation of } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in the computation of } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in the computation of } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in the computation of } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in the computation of } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only on } \lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}, \text{ which appear only in } I(\underline{\lambda}) \text{ depends only only } I(\underline{\lambda}) \text{ depends }$$

the outermost integral, we consider them as constants for all the inner integrals,

which means that we have
$$\zeta^{\wedge}_{L_{5,p}}(s) = \int_{\underline{\lambda}} I(\underline{\lambda}) \int_{\underline{a}} \int_{\underline{b}} \int_{\underline{c}} 1 d\mu(\underline{c}) d\mu(\underline{b}) d\mu(\underline{a}) d\mu(\underline{\lambda}),$$

hence all the inner integrals evaluate to the measure of their domains of integration. now we compute the innermost integral by considering a, b and λ as constants, and integrating only over c. Considering the multiplication uh, we observe that for each element c_j , we must have that $\rho_j = c_j \lambda_1 \lambda_2 \lambda_3 \lambda_4 \in \mathbb{Z}_p$, which means that $v(\rho_i) = v(c_i\lambda_1\lambda_2\lambda_3\lambda_4) \ge 0 \Rightarrow v(c_i) + v_1 + v_2 + v_3 + v_4 \ge 0$ $0 \Rightarrow v(c_i) \ge -(v_1 + v_2 + v_3 + v_4)$. But this means that $c_i \in p^{-(v_1 + v_2 + v_3 + v_4)} \mathbb{Z}_p$, and since the domain of integration for this integral is $\underline{c} = \{c_1, c_2, c_3, c_4\}$, then $\mu(\underline{c}) = |c_j|_p^4 = p^{4(v_1+v_2+v_3+v_4)}$. Denote $I(\underline{\lambda},\underline{c}) := I(\underline{\lambda})p^{4(v_1+v_2+v_3+v_4)}$, we now

have that
$$\zeta_{L_{5,p}}^{\wedge}(s) = \int_{\underline{\lambda}} I(\underline{\lambda},\underline{c}) \int_{\underline{a}} \int_{\underline{b}} 1 d\mu(\underline{b}) d\mu(\underline{a}) d\mu(\underline{\lambda}).$$

Denote $\lambda_{13} := \lambda_1 \overline{\lambda}_2 \lambda_3$, $\lambda_{24} := \lambda_2 \lambda_3 \lambda_4$, and $\lambda_{14} := \lambda_1 \lambda_2 \lambda_3 \lambda_4$. We now

consider the constraints on \underline{b} .

 $b_{11}\lambda_{13}, b_{31}\lambda_{13}, b_{41}\lambda_{13} \in \mathbb{Z}_p$, and $b_{12}\lambda_{24}, b_{22}\lambda_{24} \in \mathbb{Z}_p$. These constaints are obtained by multiplying elements in block M_{13} with elements in h, but one observes that we have b_{22} also in location (5,10) of the matrix, and b_{31} in location (7,10), which means that $b_{22}\lambda_{14},b_{31}\lambda_{14}\in\mathbb{Z}_p$. But since we already have $b_{22}\lambda_{24},b_{31}\lambda_{13}\in\mathbb{Z}_p$, the constraints $b_{22}\lambda_{14}$ and $b_{31}\lambda_{14}$ do not contribute any new information. In addition, we have one of the elements of \underline{b} that forms a constraint together with elements from \underline{a} , namely $(a_{11}a_{22}-b_{11})\lambda_{24}\in\mathbb{Z}_p$. The constraints $b_{31}\lambda_{13},b_{41}\lambda_{13},b_{12}\lambda_{24},b_{22}\lambda_{24}\in\mathbb{Z}_p$ from above translate to $p^{-2(v_1+v_2+v_3)}p^{-2(v_2+v_3+v_4)}=p^{-2(v_1+2v_2+2v_3+v_4)}$. On the other hand, b_{11} is a part of two constraints, hence we must have both $b_{11}\in p^{-(v_1+v_2+v_3)}\mathbb{Z}_p$ and $a_{11}a_{22}-b_{11}\in p^{-(v_2+v_3+v_4)}\mathbb{Z}_p\Rightarrow b_{11}\in a_{11}a_{22}+p^{-(v_2+v_3+v_4)}\mathbb{Z}_p$, which means that we need to compute the measure of the intersection of the two modules $\mu\Big(p^{-(v_1+v_2+v_3)}\mathbb{Z}_p\cap a_{11}a_{22}+p^{-(v_2+v_3+v_4)}\mathbb{Z}_p\Big)$. Denote $\alpha:=v_1+v_2+v_3$, $\beta:=v_2+v_3+v_4$ and $x:=a_{11}a_{22}$, so $b_{11}\in p^{-\alpha}\mathbb{Z}_p\cap x+p^{-\beta}\mathbb{Z}_p$. Assume $\beta\geq\alpha\Rightarrow-\beta\leq-\alpha\Rightarrow p^{-\alpha}\mathbb{Z}_p\subset p^{-\beta}\mathbb{Z}_p\Rightarrow b_{11}\in p^{-\beta}\mathbb{Z}_p\cap x+p^{-\beta}\mathbb{Z}_p$.
